(54) Title: BROADCAST AND RECEPTION SYSTEM, AND CONDITIONAL ACCESS SYSTEM THEREFOR

(57) Abstract

A digital satellite television system has a plurality of set-top-boxes associated with a plurality of end users' television receivers, a modem and a decoder housed in each STB, a Subscriber Authorization System (SAS) incorporating or having associated therewith a plurality of communication servers, means included in the SAS for generating Electronic Managements Messages (EMM), a back channel interconnecting each of the STBs individually with the SAS, means included in the SAS and each STB so that the necessary information required to inject a relevant EMM into the system is supplied directly to the relevant communication server included in or associated with the SAS to authorise the release of the said EMM and/or means to connect the modem to the back channel and means whereby an EMM is transmissible to the decoder directly from a relevant communication server included in or associated with the SAS. Further important features are also disclosed.

BROADCAST AND RECEPTION SYSTEM, AND CONDITIONAL ACCESS SYSTEM THEREFOR

The present invention relates to a broadcast and reception system, in particular to a mass-market digital interactive satellite television system, and to a conditional access system therefor.

In particular, but not exclusively, the invention relates to a mass-market broadcast system having some or all of the following preferred features:-

- It is an information broadcast system, preferably a radio and/or television broadcast system
- 10 It is a satellite system (although it could be applicable to cable or terrestrial transmission)
 - It is a digital system, preferably using the MPEG, more preferably the MPEG-2, compression system for data/signal transmission
 - It affords the possibility of interactivity.
- More particularly the present invention relates to so-called pay television (or radio) where a user/viewer selects a programme/film/game to be viewed for which payment is to be made, this being referred to as a pay-per-view (PPV) or in the case of data to be downloaded a so-called pay-per-file (PPF).

with such known PPV or PPF systems a significant amount of time is required to be spent by the user/viewer in order to carry out the actions necessary to actually access the product being selected.

For example, in one known system the sequence of steps which have to be carried out are as follows:-

ar arti

which in this known system includes a number of human operators which answer the subscriber's call and to whom the subscriber communicates the necessary information concerning the selected product and concerning the financial status of the subscriber

150 Million 1

to a so-called Subscriber Authorization System (SAS) which has included in it or associated with it a plurality of communications servers.

William of office and and are a second to the control of the second of t

should be a bother and the property of some a convenient was ever of of

user before authorising the connection from the communications servers to the user's television set so that the product can be delivered and viewed by the user.

In another known system the human operator is replaced by an automatic voice server so that when the user telephones the SMS he/she hears a voice activated recording to which the user conveys the same information as I) above.

This second arrangement reduces the delay inherent in the first described arrangement 10 mm which can be more easily overloaded when large numbers of users are wishing to order a product at the same time. The same time is a second arrangement are used to be order a product at the same time.

the control eaters in with glasse or against the event tools to like the control limbs

However, even with this second arrangement the user is involved in inputting significant information in the form of lengthy serial numbers which operation provides plenty of scope for error as well as being time consuming.

- The third known arrangement involves the user making use of existing screen based systems such as MINITEL in France and PRESTEL in the United Kingdom, which systems replace the voice activated server referred to above in connection with the second arrangement. The MINITEL and PRESTEL systems themselves incorporate a modem at the consumer end.
- In all these known arrangements the user is involved in the expenditure of significant time and effort in inputting all the information necessary to enable the system to in effect authorize the transmission of the chosen product to the user's television set.

terms to a region with sort of the care of many and an execution algorithms account at a secret

interious on a qual or or export a dispensed on huge, we solve a country of the organization

and an electric prise present gritanteering for a team orders and a

In the case of a satellite television system there is a further delay involved in the user actually receiving the product selected.

In PPV and PPF systems the key element in controlling the user's access to products are so-called Entitlement Management Messages (EMM) which have to be injected into the system in order to give the user product access. More particularly the EMMs are the mechanism by which the sencrypted data representative of a product is 5 mudecrypted for a particular individual user. The entitle most dispresentative of a product is

cele is a section that the randoct color and section in ord which are not as

In known satellite television systems the EMMs are transmitted to the user's televisions via the satellite link at regular intervals in the MPEG-2 data stream. Thus again the case of a particular user's EMM there can be a significant delay of perhaps several minutes before the user's next EMM transmission arrives at that user's television set.

in the user having to manually input certain data; into the (system of The cumulative and effect of these two delays is that it may take perhaps typically five minutes for a user and alternate to be able to gain access to the selected productive sale in the cumulative and assistant of the cumulative and assistant of

15 The present invention is concerned with overcoming this problem. The present invention is concerned with overcoming this problem.

An overview of a digital television broadcast and reception system 1000 according to 10 the present invention is shown in Figure 1. The invention includes a mostly conventional digital television system 2000 which uses: the known aMPEG-2 compression system to transmit compressed digital signals. In more detail, MPEG-2 compressor 2002 in a broadcast centre receives a digital signal stream (typically a stream of video signals). The compressor 2002 is connected to a multiplexer and 15 scrambler 2004 by linkage 2006. The multiplexer 2004 receives a plurality of further input signals, assembles one or more transportestreams and transmits compressed. digital signals to a transmitter 2008 of the broadcast centre via linkage 2010, which can of course take a wide variety of forms including telecom links. The transmitter 2008 transmits electromagnetic signals via uplink 2012 towards a satellite transponder 20 2014, where they are electronically processed and broadcast via notional downlink 2016 to earth receiver 2018, conventionally in the form of a dish owned or rented by the end user. The signals received by receiver 2018 are transmitted to an integrated receiver/decoder 2020 owned or rented by the end user and connected to the end user's television set 2022. The receiver/decoder 2020 decodes the compressed MPEG-2 25 signal into a television signal for the television set 2022.

A BUTTO LESS

19 11 JAW

date of the state of the state

A conditional access system 3000 is connected to the multiplexer 2004 and the receiver/decoder 2020, and is located partly in the broadcast centre and partly in the decoder. It enables the end user to access digital television broadcasts from one or more broadcast suppliers. A smartcard, capable of decrypting messages relating to commercial offers (that is, one or several television programmes sold by the broadcast supplier), can be inserted into the receiver/decoder 2020. Using the decoder 2020 and smartcard, the end user may purchase events in either a subscription mode or a payper—view mode.

An interactive system 4000, also connected to the multiplexer 2004 and the receiver/decoder 2020 and again located partly in the broadcast centre and partly in the decoder, enables the end user to interact with various applications via a modemmed back channel 4002.

The conditional access system 3000 is now described in more detail.

្សាស្ត្រ ការ៉ាស់ ស្ត្រី(អាចម្នៃស្ត្រី) ស្ត្រាស់ ស្ត្រី ក្រុង ស្ត្រី ស្ត្

The first like a first first of the order of the second of

Alland of the bring property theory and a rest of the

With reference to Figure 2, in overview the conditional access system 3000 includes a Subscriber Authorization System (SAS) 3002. The SAS 3002 is connected to one or more Subscriber Management Systems (SMS) 3004, one SMS for each broadcast supplier, by a respective TCP-IP linkage 3006 (although other types of linkage could alternatively be used). Alternatively, one SMS could be shared between two broadcast suppliers, or one supplier could use two SMSs, and so on:

First encrypting units in the form of ciphering units 3008 utilising "mother" smartcards 3010 are connected to the SAS by linkage 3012. Second encrypting units again in the form of ciphering units 3014 utilising mother smartcards 3016 are connected to the multiplexer 2004 by linkage 3018. The receiver/decoder 2020 receives a "daughter" smartcard 3020. It is connected directly to the SAS 3002 by Communications Servers 3022 via the modernmed back channel 4002. The SAS sends amongst other things subscription rights to the daughter smartcard on request.

Multiplexer and Scrambler 10

the programme.

13" data:

With reference to Figures 1 and 2, in the broadcast centre, the digital video signal is first compressed (or bit rate reduced), using the MPEG-2 compressor 2002. This compressed signal is then transmitted to the multiplexer and scrambler 2004 via the linkage 2006 in order to be multiplexed with other data; such as other compressed 2 moreye and enighture radisculate a

cr mare Subcomber "deagrance 24J) 3JT The scrambler generates a control word used in the scrambling process and included in the MPEG-2 stream in the multiplexon 2004 :: The control word is generated internally and enables the end user's integrated receiver/decoder 2020 to descramble

First encrypting units in the form in the frugula is baddle in a plan table entercards 20 Access criteria, indicating how the programme is commercialised, are also added to the MPEG-2 stream. The programme may be commercialised in either one of a number of "subscription" modes and/or one of a number of "Pay Per View" (PPV) modes or events. In the subscription mode, the end user subscribes to one or more commercial offers, or "bouquets", thus getting the rights to watch every channel inside ay sida those bouquets. In the preferred embodiment up to 260 commercial offers may be 25 selected from a bouquet of channels. In the Pay Per View mode, the end user is provided with the capability to purchase events as he wishes. This can be achieved by either pre-booking the event in advance ("pre-book mode"), or by purchasing the event as soon as it is broadcast ("impulse mode"). In the preferred embodiment, all users are subscribers, whether or not they watch in subscription or PPV mode, but of course PPV viewers need not necessarily be subscribers.

Both the control word and the access criteria are used to build an Entitlement Control Message (ECM); this is a message sent in relation with one scrambled program; the message contains a control word (which allows for the descrambling of the program) and the access criteria of the broadcast program. The access criteria and control word are transmitted to the second encrypting unit 3014 via the linkage 3018. In this unit, an ECM is generated, encrypted and transmitted on to the multiplexer and scrambler 2004.

Each service broadcast by a broadcast supplier in a data stream comprises a number of distinct components; for example a television programme includes a video component, an audio component, a sub-title component and so on. Each of these components of a service is individually scrambled and encrypted for subsequent broadcast to the transponder 2014. In respect of each scrambled component of the service, a separate ECM is required.

Programme Transmission

and so the converse and the first property of the

UNIFO SPOCED TO TELLER

The multiplexer 2004 receives electrical signals comprising encrypted EMMs from the 20 SAS 3002, encrypted ECMs from the second encrypting unit 3014 and compressed programmes from the compressor 2002. The multiplexer 2004 scrambles the programmes and transmits the scrambled programmes, the encrypted EMMs and the encrypted ECMs as electric signals to a transmitter 2008 of the broadcast centre via linkage 2010. The transmitter 2008 transmits electromagnetic signals towards the satellite transponder 2014 via uplink 2012.

Programme Reception

5

2018, conventionally in the form of a dish owned or rented by the end user, via downlink 2016. The signals received by receiver 2018 are transmitted to the integrated receiver/decoder 2020 owned or rented by the end user and connected to the end user's television set 2022. The receiver/decoder 2020 demultiplexes the signals to obtain scrambled programmes with encrypted EMMs and encrypted ECMs.

If the programme is not scrambled, that is, no ECM has been transmitted with the MPEG-2 stream, the receiver/decoder 2020 decompresses the data and transforms the signal into a video signal for transmission to television set 2022.

If the programme is scrambled, the receiver/decoder 2020 extracts the corresponding ECM from the MPEG-2 stream and passes the ECM to the "daughter" smartcard 3020 10 of the end user. This slots into a housing in the receiver/decoder 2020. The daughter smartcard 3020 controls whether the end user has the right to decrypt the ECM and to access the programme. If not, a negative status is passed to the receiver/decoder 2020 to indicate that the programme cannot be descrambled. If the end user does have the rights, the ECM is decrypted and the control word extracted. The decoder 2020 can then descramble the programme using this control word. The MPEG-2 stream is decompressed and translated into a video signal for onward transmission to television set 2022.

Subscriber Management System (SMS)

The multiplexer 2054 receives als 20 A Subscriber Management System (SMS) 3004 includes a database 3024 which manages, amongst others, all of the end user files, commercial offers (such as tariffs and promotions), subscriptions, PPV details, and data regarding end user consumption and authorization. The SMS may be physically remote from the SAS.

Each SMS 3004 transmits messages to the SAS 3002 via respective linkage 3006 which imply modifications to or creations of Entitlement Management Messages 25 (EMMs) to be transmitted to end users. TO THE TRUE SECRETOR

the multiple transporder 2014 receives und r The SMS 3004 also transmits messages to the SAS 3002 which imply no

modifications or creations of EMMs but imply only a change in an end user's state (relating to the authorization granted to the end user when ordering products or to the amount that the end user will be charged).

As described later, the SAS 3002 sends messages (typically requesting information such as call-back information or billing information) to the SMS 3004, so that it will be apparent that communication between the two is two-way.

Entitlement Management Messages (EMMs)

enserve and attack and are not semplificant. The large

accordance and property of the Carlo Carlo

The EMM is a message dedicated to an individual end user (subscriber), or a group of end users, only (in contrast with an ECM, which is dedicated to one scrambled programme only or a set of scrambled programmes if part of the same commercial offer). Each group may contain a given number of end users. This organisation as a group aims at optimising the bandwidth; that is, access to one group can permit the reaching of a great number of end users.

m) ...3

Various specific types of EMM are used in putting the present invention into practice. Individual EMMs are dedicated to individual subscribers, and are typically used in the provision of Pay Per View services; these contain the group identifier and the position of the subscriber in that group. So-called "Group" subscription EMMs are dedicated to groups of, say, 256 individual users, and are typically used in the administration of This EMM has a group identifier and a subscribers' some subscription services. group bitmap. Audience EMMs are dedicated to entire audiences, and might for example be used by a particular operator to provide certain free services. An "audience" is the totality of subscribers having smartcards which bear the same Operator Identifier (OPI). Finally, a "unique" EMM is addressed to the unique identifier of the smartcard for 1971 be industrianed by the property of the smart and the smart and

25. The structure of a typical EMM is now described with reference to Figure 3. Basically, the EMM, which is implemented as a series of digital data bits, comprises a header 3060, the EMM proper 3062, and a signature 3064. The header 3060 in turn comprises a type identifier 3066 to identify whether the type is individual, group,

and MAMA difference of Daniel of the terror with EAMed and

andience or some other type, a length identifier 3068 which gives the length of the EMM, an optional address 3070 for the EMM, an operator identifier 3072 and a key identifier 3074. The EMM proper 3062 of course varies greatly according to its type. Finally, the signature 3064, which is typically of 8 bytes long, provides a number of 5006 checks against corruption of the femalining data in the EMM.

Subscriber Authorization System (SAS) Has a place and the larger and

pario, to the SMS I Was read to ill

The messages generated by the SMS 3004 are passed via linkage 3006 to the Subscriber Authorization System (SAS) 3002, which in turn generated messages acknowledging receipt of the messages generated by the SMS 3004 and passes these to the SMS 3004.

server, and is able to emit accurate messages. When an error occurs in a message (parameter out of range, missing parameter, and so on). It traces incoming commands in textual form in a trace file 3110 and also in binary form in a replay file 3112 in order to be able to replay a series of commands. Traces can be disabled and the size of files limited.

r Mani Angeles and the company of th

Detailed discussion of the STM server 3104 is now provided with particular reference to Figure 6. The STM server is effectively the main engine of the Subscription Chain area, and has the purpose of managing free rights, the creation of new subscribers and the renewal of existing subscribers. As shown in the figure, commands are passed on 105 to the Message Generator 3106, albeit in a different format from that in which the commands are passed to the STM server. For each command, the STM server is arranged to send an acknowledgement message to the CI only when the relevant command has been successfully processed and sent to the MG.

The STM server includes a subscriber database 3120, in which all the relevant 15% parameters of the subscribers are stored (smartcard number, commercial offers, state, 2000) group and position in the group, and so on). The database performs semantic checks do of the commands sent by the CI 3102 against the content of the database, and updates the database when the commands are validable base 2002 allowed the out

Both and the said of the control of the said enthalt abords which are about that it

Provide the CRIP RE out in bollon to this 60RE

The STM server further manages a First In First Out (FIFO) buffer X122 between the STM server and the MG, as well as a backup disk FIFO 3124. The purpose of the FIFOs is to average the flow of commands from the Claifethe MG is not able to respond for a while for any reason. They can also ensure that in the case of a crash of the STM server or MG no command will be lost, since the STM server is arranged to empty (that is, send to the MG) its FIFOs when restarted The FIFOs are

The STM server includes at its core an automatic renewal server 3126 which gain automatically generates renewals, and, if required by the operators, free rights. In this context, the generation of renewals may be thought of ascincluding the generation of

noting the desparebiling transpages for the little of the

्रीयभावती का गाहरी प्राप्ता है

rights for the first time, although it will be understood that the generation of new rights is initiated at the SMS. As will become apparent, the two can be treated by roughly the same commands and EMMs.

Having the STM separate from the SAS, and the automatic renewal server within the SAS rather than (in known systems) in the SMS 3004, is a particularly important feature, since it can significantly reduce the number of commands which need to be passed from the SMS to the SAS (bearing in mind that the SMS and SAS may be in different locations and operated by different operators). In fact, the two main commands required from the SMS are merely commands that a new subscription should be started and that an existing subscription should be stopped (for example in the case of non-payment). By minimising command exchange between the SMS and SAS, the possibility of failure of command transfer in the linkage 3006 between the two is reduced; also, the design of the SMS does not need to take into account the features of the conditional access system 3000 generally.

Automatic renewal proceeds in the fashion indicated in the flow diagram of Figure 7. In order to reduce bandwidth, and given that a very high percentage of all renewals are standard, renewal proceeds in groups of subscribers; in the preferred embodiments there are 256 individual subscribers per group. The flow diagram begins with the start step 3130, and proceeds to step 3132 where a monthly activation of the renewal function is made (although of course it will be appreciated that other frequencies are also possible). With a monthly frequency, rights are given to the end user for the current month and all of the following month, at which point they expire if not renewed.

mays in the confidence of postulation in the confidence of

In step 3134 the subscribet database 3120 is accessed in respect of each group and each individual within that group to determine whether rights for the particular individual are to be renewed:

the consent landow here again to self mere morning a little at mere to be the light of and the

In step 3136, a group subscription bitmap is set up according to the contents of the subscriber database, as shown in Figure 8.—The bitmap comprises a group identifier

•

Thirton most Midshig. 1. "

ali milih ngarak lawatan dan talih da

(in this case Group 1 - "GI") 3138 and 256 individual subscriber zones 3140. The individual bits in the bitmap are set to 1 or zero according to whether or not the particular subscriber is to have his rights renewed. Actypical set of binary data is shown in the figure.

5650 In step 3142 the appropriate commands, including the group subscription bitmap, are passed to the Message Generator 3106. In step 3143 the Message Generator sets an obsolescence date to indicate to the smartcard the date beyond which the particular subscription EMM is not valid; typically this date is set as the end of the next month.

10 in step 3144 the Message Generator generates from the commands appropriate group.

10 in subscription EMMs and asks the Ciphering Unit 3008 to cipher the EMMs, the interciphered EMMs being then passed to the EMM Injector 3300, which, in step 3146, and injects the EMMs into the MPEG-2 data stream.

Step 3148 indicates that the above described procedure is repeated for each and every group. The process is finally-brought to an end at stop step 3150 model and the In order to reduce bandwidth, a pi of the 15000. The aflow diagram described above with, reference to Figure 1700 relates in fact respecifically to the renewal of subscriptions. The STM also manages in a similar way கலாக free audience rights and new subscribers. பி. முரை விறைய நிரு மிறியிருள்ள function is made (although of course it will (B) ar in quemoins are buleto nga out 10 In the case of free audience rights, available for specifid television programmes or groups of such programmes, these are made available by the STM issuing a command to the Message Generator to generate appropriate audience EMMs (for a whole 20 audience) with an obsolescence date a given number of days (or weeks) hence. The 1874 MG computes the precise obsolescence date based on the STM command. adi leud white the goes a decretic white 1 15.35 100

In the case of new subscribers, these are dealt with in two stages. Firstly, on purchase the smartcard in the receiver/decoder 2020 (if desired by the operator) affords the subscriber free rights for a given period (typically a few days). This is achieved by generating a bitmap for the subscriber which includes the relevant obsolescence date.

The subscriber then passes his completed paperwork to the operator managing the subscriber (at the SMS). Once the paperwork has been processed, the SMS supplies to the SAS a start command for that particular subscriber. On receipt by the SAS of the start command, the STM commands the MG to assign a unique address to the new subscriber (with a particular group number and position within the group) and to generate a special, so-called "commercial offer" subscription EMM (as opposed to the more usual "group" subscription EMM used for renewals) to provide the particular subscriber with rights until the end of the next month. From this point renewal of the subscriber can occur automatically as described above. By this two stage process it is possible to grant new subscribers rights until the SMS issues a stop command.

It is to be noted that the commercial offer subscription EMM is used for new subscribers and for reactivation of existing subscribers. The group subscription EMM is used for renewal and suspension purposes.

COS WALE TO LET VEGOS FUNCES OF LIVE OF SIZE ALL A

With reference to Figure 9, a typical subscription EMM proper (that is, ignoring the header and signature) generated by the above procedure comprises the following main portions, namely typically a 256 bit subscription (or subscribers' group) bitmap 3152, 128 bits of management ciphering keys 3154 for the ciphering of the EMM, 64 bits of each exploitation ciphering key 3156 to enable the smartcard 3020 to decipher a control word to provide access to broadcast programmes, and 16 bits of obsolescence date 3158 to indicate the date beyond which the smartcard will ignore the EMM. In fact in the preferred embodiment three exploitation keys are provided, one set for the present month, one set for the next month, and one for resume purposes in the event of system failure.

In more detail, the group subscription EMM proper has all of the above components, except the management ciphering keys 3154. The commercial offer subscription EMM proper (which is for an individual subscriber) includes instead of the full subscribers' group bitmap 3152 the group ID followed by the position in the group, and then management ciphering keys 3154 and three exploitation keys 3156, followed by the relevant obsolescence date 3158.

医大学 医人氏试验 进步的第

Adolf Louiseque e

1. 1 . . .

The Message Generator 3106 serves to transform commands issued by the STM server 3104 into EMMs for passing to the Message Emitter 3302. With reference to Figure 5, firstly, the MG produces the EMMs proper and passes them to the Ciphering Unit 3008 for ciphering with respect to the management and exploitation keys. The CU 5 completes the signature 3064 on the EMM (see Figure 3) and passes the EMM back to the MG, where the header 3060 is added. The EMMs which are passed to the Message Emitter are thus complete EMMs. The Message Generator also determines the broadcast start and stop time and the rate of emission of the EMMs, and passes these as appropriate directions along with the EMMs to the Message Emitter. The 10 MG only generates a given EMM once; it is the ME which performs its cyclic transmission.

Again with reference to Figure 5, the Message Generator includes its own EMM database 3160 which, for the lifetime of the relevant EMM, stores it. It is erased once its emission duration has expired. The database is used to ensure consistency between 15 the MG and ME, so that for example when an end user is suspended the ME will not continue to send renewals. In this regard the MG computes the relevant operations and sends them to the ME. () words was a tid 2 22 a glassicy glasses are and r - E. De Ligainadig a transplutific alle P.D.

in a to be pover such the characters.

On generation of an EMM, the MG assigns a unique identifier to the EMM. When the MG passes the EMM to the ME, it also passes the EMM TD. This enables 20 dentification of a particular EMM at both the MG and the ME. of 3818 also fact in the preferred embedingers three explicitions age ade tot the site and

Also concerning the Subscription Chain area, the Message Generator includes two FIFOs 3162 and 3164, one for each of the relevant Message Emitters 3302 and 3304 in the EMM Injector 3300, for storing the ciphered EMMs. Since the Subscription Chain area and EMM Injector may be a significant distance apart; the use of FIFOs 25 can allow full continuity in EMM transmission even if the links 3166 and 3168 between the two fail. Similar FIFO's are provided in the Pay Per View Chain area. Common MES comité que plante coar c

One particular feature of the Message Generator in particular and the conditional access system in general concerns the way that it reduces the length of the EMM

ing programme in the

proper 3062 by mixing parameter length and identifier to save space. This is now described with reference to Figure 10 which illustrates an exemplary EMM (in fact a PPV EMM, which is the simplest EMM). The reduction in length occurs in the Pid (Packet or "Parameter" identifier) 3170. This comprises two portions, the actual ID 3172, and the length parameter for the packet 3174 (necessary in order that the start of the next packet can be identified). The whole Pid is expressed in just one byte of information, 4 bits being reserved for the ID, and four for the length. Because 4 bits is not sufficient to define the length in true-binary fashion, a different correspondence between the bits and the actual length is used, this correspondence being represented in a look-up table, stored in storage area 3178 in the Message Generator (see Figure 5). The correspondence is typically as follows:-

0000 au=1 1 2 10 6 do mit. 0001 = ്ട്യ മുട്ടാ പ്രീപ് വാദ്യമാൻ ഉട്ടാന്യ 2വരുടെ വാദ്യാന് ക്രിക്ക് വാദ്യാന് വാദ്യാന് വാദ്യാന് വാദ്യാന് 15 Latin Stiffer *Room 0011 j. #1 prob3/ma sec. | } The state of the second of the second 0100 = 4 0101 = della di la partir di la partir di 1.5 . 1 3.6 · · · · · · 01·10 co≡ · · · sa 6 · · and the common **0114** , ≒or i **7** call to the 20 1000 = 8 The Francisco Science 1001 = there yet today samilor 010 well by credit in a line of the control of G 1100 = 1111 = 32 -

earlier randoment and and 120 120 that the large of the first section

It will be seen that the length parameter is not directly proportional to the actual length of the packet; the relationship is in part more quadratic rather than linear. This allows for a greater range of packet length.

Pay Per View Chain Area

io en lor hor filterol carb

Concerning the Pay Per View Chain area 3200; with reference to Figure 5 in more detail the Authorisation Server 3202 has as its client the Order Centralized Server Cl. 3207; which requests information about teach subscriber which connects to the Communications Servers 3022 to purchase a PPV product.

If the subscriber is known from the AS 3202, a set of transactions takes place. If the subscriber is authorized for the order, the AS creates will and sends it to the OCS.

Otherwise, it signals to the OCS that the order is not authorized.

cacent, fix

It is only at the end of this set of transactions that the AS updates the end users database 3204 via the database servers (DBAS) 3206, if at least one transaction was authorized; this optimizes the number of database accesses.

The criteria according to which the AS authorizes purchase are stored in the database, accessed through DBAS processes. In one embodiment, the database is the same as the database accessed by the STM.

Depending on consumer profile, the authorization may be denied (PPV_Forbidden,Casino_Forbidden ...). These kind of criteria are updated by STM 3104, on behalf of the SMS 3004.

Other parameters are checked, such as limits allowed for purchase (either by credit card, automatic payment, or number of authorized token purchases per day).

1.

SE.

In case of payment with a credit card, the number of the card is checked against a local blacklist stored in the local blacklist database 3205.

When all the verifications are successful, the AS:-

Generates a bill and sends it to the OCS; which completes: this bill and stores it in a file, this file being later sent to the SMS for processing: (customer actual billing); and

2. Updates the database, mainly to set new purchase limits.

This check-and-generate-bill-if-OK mechanism applies for each command a subscriber may request during a single connection (it is possible to order e.g. 5 movies in a single session).

It is to be noted that the AS has a reduced amount of information concerning the subscriber, by comparison with that held by the SMS. For example, the AS does not hold the name or address of the subscriber. On the other hand, the AS does hold the smartcard number of the subscriber, the subscriber's consumer category (so that different offers can be made to different subscribers), and various flags which state whether, for example, the subscriber may purchase on credit, or he is suspended or his smartcard has been stolen. Use of a reduced amount of information can help to reduce the amount of time taken to authorize a particular subscriber request.

The main purpose of the DBASs 3206 is to increase database performance seen from the AS, by paralleling the accesses (so actually it does not make much sense to define a configuration with only one DBAS). An AS parameter determines how many DBASes should connect. A given DBAS may be connected to only one AS.

The OCS 2307 mainly deals with PPV commands. It operates in several modes.

Firstly, it operates to process commands issued by the SMS, such as product refreshment (for instance, if the bill is already stored by the SMS, no bill is generated by the OCS), update of the wallet in the smartcard 3020, and session cancellation/update.

tell gallering garde Engl

THE ROOM WAS SHORE THE FELL TO

- 1. Identifying the relevant subscriber (using the AS 3202);
- 2. If valid, generate adequate commands to the Message Generator, in order to send an appropriate EMM. Commands may be:

Update of the wallet,

to glicanti il come di mente con interest

. .. paint over in which to a class out all

Session erasure.

Note that these operations do not imply creation of billing information, since billing is already known from the SMS. These operations are assimilated to "free products" purchase.

Secondly, the OCS deals with commands received from the subscribers through the Communications Servers 3022. These may be received either via a modem connected to the receiver/decoder 2020, or by voice activation via the telephone 4001, or by key activation via a MINITEL, PRESTEL or like system where available.

Thirdly, the OCS deals with callback requests issued by the SMS. These last two modes of operation are now discussed in more detail.

In the second type of mode described above it was stated that the OCS deals with commands received directly from the end user (subscriber) through the Communications Servers 3022. These include product orders (such as for a particular PPV event), a subscription modification requested by the subscriber, and a reset of a parental code (a parental code being a code by which parents may restrict the right of access to certain programmes or classes of programmes).

The way in which these commands are dealt with is now described in more detail with reference to Figure 11.

Product orders by a subscriber involve the following steps:

- 20 1. Identifying through the AS the caller who is making a call through the CS 3022 ordering a particular product;
- 2. Checking the caller's request validity, again using the AS (where the order is placed using the receiver/decoder 2020, this is achieved by verifying the smartcard 3020 details);
- 25 3. Ascertain the price of the purchase;
 - 4. Check that the price does not exceed the caller's credit limit etc;
 - 5. Receiving a partial bill from the AS; Land to establish

1.1

 $G^{(i)}$

- 6. Filling additional fields in the bill to form a completed bill;
- Adding the completed bill to a billing information storage file 3212 for later 7. processing; and
- -8. Sending corresponding command(s) to the PPV Message Generator 3210 to 5 generate the relevant EMM(s).

The EMM(s) is sent either on the modem line 4002 if the consumer placed the product order using the receiver/decoder 2020 (more details of this are described later), or else it is broadcast. The one exception to this is where there is some failure of the modem connection (in the case where the consumer places the order using the 10 , receiver/decoder); in this event the EMM is broadcast over the air.

A subscription modification requested by a subscriber involves:

1. Identifying the caller (using the AS);

The off rank alies, and also a bound

to comit sour meder links becaused a causal .

- Sending information to the Command Interface; the CI in turn forwards this 2. information to the SMS; and
- Via the CI, the OCS then receives an answer from the SMS (in terms of the 3. cost of the modification, if the modification is possible).

If modification was requested using the receiver/decoder, the OCS generates a confirmation to the SMS. Otherwise, for example in the case of phone or Minitel, the subscriber is prompted for confirmation and this answer sent to the SMS via the OCS 204 h and the Claus 0002 teber abbreviewer environment with the contract of the

particular case the EMM(s) are broadcast only on air, never on the telephone line. the digit factor of the control of the digital and the second of the difference of t

It will be understood from the above examples of different modes of operation of the OCS that the user can have direct access to the SAS, and in particular the OCS and AS, in that the Communications Servers are directly connected to the SAS, and in particular the OCS. This important feature is concerned with reducing the time for the user to communicate his command to the SAS. The to the state of the same o

Till take tell represent oil a med at back tool in.

This feature is illustrated further with reference to Figure 12, from which it can be seen that the end user's Set-Top-Box, and in particular its receiver/decoder 2020, has the capability of communicating directly with the Communications Servers 3022 associated with the SAS 3002. Instead of the connection from the end user to the 10 Communications Servers 3022 of the SAS 3002 being through the SMS 3004 the connection is directly to the SAS 3002. and the free detailment getören.

In fact, as directly mentioned two direct connections are provided. Made Children O'S theam

The first direct connection is by a voice link via a telephone 400 and appropriate telephone line (and/or by MINITEL or like connection where available) where the end 15 users still have to input a series of voice commands or code numbers but time is saved compared with the communication being via the SMS 3004. sunscriber is pramoted for continual, 🕟

The second direct connection is from the receiver/decoder 2020 and the input of data is achieved automatically by the end user inserting his own daughter smartcard 3020 thus relieving the end user of the job of having to input the relevant data which in 20 turn reduces the time taken and the likelihood of errors in making that input: Sem in Robert meret bei Er in in in

A further important feature which arises out of the above discussion is concerned with reducing the time taken for the resulting EMM to be transmitted to the end user in order to initiate viewing by the end user of the selected product.

providing the end user's receiver/decoder 2020 with the capability of communicating directly with the Communications Servers 3022 associated with the SAS 3002.

I This contrasowns agent

As described earlier the integrated receiver/decoder 2020 is connected directly to the Communications Servers: 3022 by the modemmed back channel 4002 so that commands from the decoder 2020 are processed by the SAS 3002, messages generated (including EMMs) and then sent back directly to the decoder 2020 through the back channel 4002. A protocol is used in the communication between the CS 3022 and the receiver/decoder 2020 (as described later), so that the CS receive acknowledgement of receipt of the relevant EMM, thereby adding certainty to the procedure.

Thus, for example, in the case of a pre-book mode the SAS 3002 receives messages from the endouser via the smartcard and decoder 2020 via its modem and via the telephone line 4002, requesting access to a specific event/product, and returns a suitable EMM via the telephone line 4002 and modem to the decoder 2020, the modem and decoder being preferably located together in a Set-Top-Box (STB). This is thus achieved without having to transmit the EMM in the MPEG-2 data stream 2002 via the multiplexer and scrambler 2004, the uplink 2012, satellite 2014 and datalink 2016 to enable the end user to view the event/product. This can save considerably on time and bandwidth. Virtual certainty is provided that as soon as the subscriber has paid for his purchase the EMM will arrive at the receiver/decoder 2020.

The first manifestation of the property of the control of the first between

20 deals with callback requests issued by the SAS. This is illustrated with reference to Figure 13 and Typical callback, requests have the purpose of ensuring that the receiver/decoder 2020 calls back the SAS via the modernmed back channel 4002 with the information that the SAS requires of the receiver /decoder.

ye bavroor si doiriw godinoù mobien s son, .

As instructed by the Command Interface 3102, the subscription chain Message Generator 3106 generates and sends to the receiver/decoder 202 a callback EMM. This EMM is ciphered by the Ciphering Unit 3008 for security reasons. The EMM may contain the time/date at which the receiver/decoder should wake up and perform

along to measure that was present on the original

2. La callback on its own, without being explicitly solicited; the EMM may also typically contain the phone numbers which the terminal must dial, the number of further attempts after unsuccessful calls and the delay between two calls.

As described content that meganical 51 6: 1.22 3 - 200 + 2 2 102 1 When receiving the EMM, or at the specified time-date, the receiver/decoder connects 5% 670 to the Communications Servers 8022. The OCS 3207 first identifies the caller, using the AS 3202, and verifies certain details, such as smartcard operator and subscriber sith details. The OCS then asks the smartcard 3020 to send various ciphered information times (such as the relevant session numbers, when the session was watched; how many times the subscriber is allowed to view the session again, the way in which the session was viewed, the number of remaining tokens, the number of prebooked sessions, etc). This 10 26 information is deciphered by the PPW chain Message Generator 3210; again using the and a Ciphering Unit 3008. The OCS adds this information to a callback information. s storage file 3214 for later processing and passing to the SMS 3004. The information and this ciphered for security reasons. LaThe whole approcedure his repeated until there is a 15dT nothing more to be read from the smartcard. It is the galled to it see but misborn is the stableve without hoving smit TAN In Contract Court Stream bus a One particular preferred feature of the callback facility is that before reading the ismartcard (so just after the identification of the caller using the AS 3202 as described odr as above) a check is made by the SAS 3002 that the receiver/decoder is indeed a genuine 0202 one rather than a pirated version or computer simulation. Such a check is carried out in the following manner. The SAS generates a random number, which is received by 20 200 othe receiver/decoder, ciphered, and then returned to the SAS. The SAS deciphers this of enamembers If the deciphering is successful and the original random number is retrieved, add that is concluded that the receiver/decoder is genuthe; and the procedure continues. them 2. Otherwise, the procedure is discontinued, and the market 0.000 tobar and the of the wilder than the SAS regulated the talke we will

Other functions which may occur during the callback are erasure of obsolete sessions against on the smartcard, or filling of the wallet (this latter also being described later under the section entitled "Smartcard"). The basis is a sense may 60% and the latter of 30% and against the section at the section of 30% and against (O end of berodge at the section at the Also as regards the Pays Per View Chain area (3200, description is now made of the

communications Servers 3022. At the hardware level, these comprise in the preferred embodiment a DEC Four parallel processor machine. At the software architecture level, with reference to Figure 14, in many respects the Communications Servers are conventional. One particular divergence from conventional designs arises from the fact that the Servers must serve both receiver/decoders 2020 and voice communication with conventional telephones 4001; as well possibly as MINITEL or like systems.

It will be noted in passing that two Order Centralized Servers 3207 are shown in Figure 14 (as "OCS1" and "OCS2"). Naturally any desired number may be provided.

The Communication Servers include two main servers ("CS1" and "CS2") as well as a number of frontal servers ("Frontal 1" and "Frontal 2"); whilst two frontal servers are shown in the figure; typically 10 or 12 may be provided per main server. Indeed, although two main servers CS1 and CS2 and two frontal servers, Frontal 1 and Frontal 2, have been shown; any number could be used. Some redundancy is usually desirable.

(reception), "VTX" (MINITEL, PRESTEL or the like), "VOX" (voice communication), and "TRM" (communication with the receiver/decoder). These are coupled to the "BUS" for communication of signals to the Frontal servers.

CS1 and CS2 communicate directly with the receiver/decoders 2020 via their modemmed back channels 4002 using the X25 public network common protocol. The relatively low-level protocol between the Communications Servers 3022 and the receiver/decoders 3020 is in one preferred embodiment based upon the V42 standard international CCITT protocol, which provides reliability by having error detection and data re-transmission facilities, and uses a checksum routine to check the integrity of

sautiane Elemente i

ni aworz bik in SE

BESTER STATE OF THE

the re-transmission. An escape mechanism is also provided innorder to prevent the transmission of disallowed characters.

to the relevance of the election of the

w. was griewig in the way the

100 or halfyrod to 200 har "

On the other hand, voice telephone communication is carried out via the Frontal Communications Servers, each capable of picking up, say, 30 simultaneous voice connections from the connection 3234 to the local telephone network via the high speed "T2" (E1) standard telephony ISDN lines.

Three particular functions of the software portion of the Communications Servers (which could of course alternatively be implemented fully in hardware) are firstly to convert the relatively low level protocola information received from the receiver/decoder into the relatively high level protocol information output to the OCS, secondly to attenuate or control the number of simultaneous connections being made, and thirdly to provide several simultaneous channels without any mixing. In this last regard, the Communications Servers play the role of a form of multiplexer, with the interactions in a particular channel being defined by a given Session ID (identifier), which is in fact used throughout the communication chain.

Finally as regards the Pay Per View Chain area 3200; sand with reference again to Figure 5, the Server for Programme Broadcast (SPB) 3208 is coupled to one or more Programme Broadcasters 3250 (which would typically be located remotely from the SAS) to receive programme information at The SPB filters out for further use information corresponding to PPV events (sessions).

A particularly important feature is that the filtered programme event information is passed by the SPB to the MG which in turn sends a directive (control command) to the ME to change the rate of cyclic emission of the EMMs in given circumstances; this is done by the ME finding all EMMs with the relevant session identifier and changing the cycle rate allocated to such EMMs. This feature might be thought of as a dynamic allocation of bandwidth for specific EMMs. Cyclic EMM emission is discussed in more detail in the section below/concerned with the EMM Injector.

the contract of the contract o

la volta a

The second of the second

The circumstances in which the cycle rate is changed are now described with reference to Figure 15; which demonstrates how cycle rate 3252 is raised a short while (say 10 minutes) before a particular PPV programme event until the end of the event from a slow cycle rate of say once every 30 minutes to a fast cycle rate of say once every 30 seconds to 1 minute in order to meet the anticipated extra user demand for PPV events at those times. In this way bandwidth can be allocated dynamically according to the anticipated user demandate. This can assist in reducing the overall bandwidth requirement.

The cycle rate of other EMMs may also be varied. For example the cycle rate of subscription EMMs may be varied by the Multiplexer and Scrambler 2004 sending the appropriate bitrate directive and the sending the

with EMM Injector Park and alests from the Cart of the Artist

Concerning the EMM Injector 3300, details of the Message Emitters 3302 to 3308, forming part of the EMM Injector and acting as output means for the Message 15 Generator, are now described with reference to Figure 16. Their function is take the EMMs and to pass them cyclically (in the manner of a carousel) via respective links 3314 and 3316 to the Software Multiplexers 3310 and 3312 and thence to the hardware multiplexers and scramblers 2004. In return the software multiplexers and scramblers 2004 generate a global bitrate directive to control the overall cycling rate 20 strong the EMMs; to do so, the MEs take into account various parameters such as the group EMMs for operators X and Y, whilst EMM_Z are other EMMs for either operator X or operator Y.

Further description proceeds for an exemplary one of the Message Emitters; it will be appreciated that the remaining MEs operate in similar fashion. The ME operates under control of directives from the MG, most notably transmission start and stop time and emission rate, as well as session number if the EMM is a PPV EMM. In relation to the emission rate, in the preferred embodiment the relevant directive may take one of five values from Very fast to Very slow. The numeric values are not specified in

guar tradition of the form of the fiver 2002 and it is the total and the fiver of t

the directive, but rather the ME maps the directive to an actual numeric value which is supplied by the relevant part of the SAS. 2. 5. Very slow - every 30 minutes

Slow

The ME has first and second databases 3320 and 3322. The first database is for those of chronological files in the database. The second database is for EMMs for immediate broadcast. In the event of a system crash, the ME is arranged to have the ability to re-read the relevant stored file and perform correct broadcast. All the files stored in the databases are updated upon request from the MG, when the MG wishes the maintain consistency between incoming directives and EMMs already sent to the maintain consistency between incoming directives and EMMs already sent to the consistency between the meaning directives and EMMs already sent to the consistency between the meaning directives and EMMs already sent to the consistency between the meaning directives and EMMs already sent to the consistency between the meaning directives and allowed the consistency of the EMMs actually being broadcast are also stored in Random Access Memory and the consistency of the EMECO 2162 and 2164 in the Message Generators and the

esting A combination of the FIFOs 3162 and 3164 in the Message Generator and the add no databases 3320 and 3322 in the Message Emitter means that the two can operate in 20.8 Y standalone mode if the link 3166 between them is temporarily broken; the ME can unitie still broadcast EMMs.

The Software Multiplexers (SMUX) 3310 and 3312 provide an interface between the MEs and the hardware multiplexers 2004. In the preferred embodiment, they each receive EMMs from two of the MEs, although in general there is no restriction on the number of MEs that can be connected with one SMUX. The SMUXs concentrate the EMMs and then pass them according to the type of EMM to the appropriate hardware multiplexer. This is necessary because the hardware multiplexers take the different types of EMMs and place them at different places in the MPEG-2 stream. The

THAT IREE

SMUX's also forward global bitrate directives from the hardware multiplexers to the MEsco and come to bound of a result of the state of

One particularly important feature of the ME is that it emits EMMs in random order.

The reason for this is as follows. The Message Emitter has no ability to sense or

control what it emits to the multiplexer. Hence it is possible that it may transmit two

EMMs which are to be received and decoded by the receiver/decoder 2020 back to
back. In such circumstances, further, it is possible that if the EMMs are insufficiently
separated the receiver/decoder and smartcard will be unable to sense and decode
properly the second of the EMMs: Cyclically emitting the EMMs in random order

can solve this problem.

and the state of the control of the

ign balling in the

The manner in which randomization is achieved is now described with reference to Figure 17; in the preferred embodiment the necessary software logic is implemented in the ADA computer language. A particularly important part of the randomization is the correct storage of the EMMs in the databases 3320 and 3322 (which are used for backup purposes) and in the RAM 3324. For a particular cycle rate and operator, the EMMs are stored in a two-dimensional array, by rank 3330 (going say from A to Z) and number in the rank 3332 (going from 0 to N). A third dimension is added by cycle rate 3334, so that there are as many two-dimensional arrays as there are cycle rates. In the preferred embodiment there are 256 ranks and typically 200 or 300 EMMs in each rank; there are 5 cycle rates. A final dimension to the array is added to

by the presence of different operators; there are as many three-dimensional arrays as

there are operators, a Storage of the data in this fashion can permit rapid retrieval in
the event that the MG wants to delete a particular EMM.

Storage of the EMMs takes place according to the "hash" algorithm (otherwise known as the "one-way hash function". This operates on a modulo approach, so that successive ranks are filled before a higher number in the rank is used, and the number of EMMs in each rank remains roughly constant. The example is considered of there being 256 ranks. When the MG sends the ME an EMM with identifer (ID) 1, the rank "1" is assigned to this EMM, and it takes the first number 3332 in the rank 3330.

The EMM with ID 2 is assigned the rank "2", and so on, up to the rank 256. The EMM with ID 257 is assigned the rank "1" again (based on the modulo function), and takes the second number in the first rank, and so on. Öbe ta nifetiliziny nij artait filamin 👝 👃 🔑 malar of districtly and the first Retrieval of a specific EMM, for example when deletion of a specific EMM is 5 requested by the MG, is effected by means of the inverse of the above. The hash algorithm is applied to the EMM ID to obtain the rank, after which the number in the the mank is found: Called and the second of the appropriate control on the destiofficially final over the law of the law of the real first influence from cost off because we The actual randomization occurs when the EMMs are, on a cyclical basis, retrieved from RAM 3324 using the randomization means 3340 which is implemented in the hardware and/or software of the Message Emitter. The retrieval is random, and again 10 based on the hash algorithm. Firstly, a random number (in the above example initially in the range 1 to 256) is chosen to yield the particular rank of interest. Secondly, a mod further random number is chosen to yield the particular number in the rank. The beau further random number is selected according to the total number of EMMs in agiven 15.39 rank: Once a given EMM has been selected and broadcast, it is, moved to a second identical storage area in the RAM 3324, again using the hash function. Hence the first area diminishes in size as the EMMs are broadcast, to the extent that, once a complete rank has been used, this is deleted. Once the first storage area is completely we empty, it is replaced by the second storage area before a new round of EMM 20 36 broadcasts and vice versal infa a net secure a contribution deep at a MME 03 by the presunce of different equipment there was the control of the many as at landmethe above fashion, after two or three cycles of the EMMs, statistically the chances of any two EMMs destined for the same end user being transmitted back to back is negligible. of the fibries takes place and the large 5,48 18 3 4 5 At regular intervals whilst the EMMs are being stored the computer 3050 computes... 25: The the number of bytes in storage and from this computes the hitrate of emission given the global bitrate directive from the multiplexer and software multiplexer. to a transaction output signal generated via his smartcard 3020 by the end user b (subscriber), as will subsequently be described.

Each operator zone 154, 155, 156 contains the identifier of the group to which the smartcard 3020 belongs, and the position of the smartcard within the group. This data enables the smartcard (along with the other smartcards in its group) to be responsive to a broadcast "group" subscription EMM having that group's address (but not the smartcard's position in the group) as well as to an "individual" (or commercial offers subscription) EMM addressed only to that smartcard within the group. There can be 256 member smartcards of each such group and this feature therefore reduces significantly the bandwidth required for broadcasting EMMs.

In order to reduce further the bandwidth required for broadcasting "group" subscription EMMs, the group data in each operator zone 154, 155, 156 and all similar zones in the EEPROM of smartcard 3020 and the other daughter smartcards is continually updated to enable a particular smartcard to change its position in each group to fill any holes created by e.g. deletion of a member of the group. The holes are filled by the SAS 3002 as in the STM server 3104 there is a list of such holes.

In this manner fragmentation is reduced and each group's membership is maintained at or near the maximum of 256 members.

Each operator zone 154, 155, 156 is associated with one or more "operator data 20% probjects" stored in the EEPROM 150. As shown in Figure 19, a series of dynamically created "operator data" objects 157-165 are located below the operator ID zones. Each of these objects is labelied with the state of the second control of the seco

Since new ECM keys are sent periodically, it is essential to prevent a user from usin old ECM keys, for example by switching off the receiver/decoder or re-setting a clock to prevent expiry of an old ECM key so that a timer in the receiver/decoder 2020 could be overridden. Accordingly operator zone 154 comprises an area (typically having a size of 2 bytes) containing an obsolescence date of the ECM keys. The smartcard 3020 is arranged to compare this date with the current date which is contained in received ECMs and to prevent decryption if the current date is later than the obsolescence date. The obsolescence date is transmitted via EMMs, as described above.

The PPV event description 167 contains a "session ID" 168 identifying the viewing session (corresponding to the program and the time and date of broadcasting) a "session mode" 169 indicating how the viewing right is being purchased (e.g. in pre-

book mode), a "session index" 170 and a "session view" 471.

In respect of receiving a programme in PPV mode, the receiver decoder 2020 determines whether the programme is one sold in PPV mode. If so, the decoder 2020

checks, using the items stored in the PPV event description 167 whether the session ID for the programme is stored therein. If the session ID is stored therein, the control word is extracted from the ECM.

could be condition. Accordingly the imprison as one dystempy

If the session ID is not stored therein, by means of a specific application the stored receiver/decoder 2020 displays a message to the end user indicating that he has the right to view the session at a cost of, say, 25 tokens, as read from the ECM or to some connect to the communications servers 3022 to purchase the event. Using the tokens, if the end user answers "yes" (by means of remote controller 2026 (see Figure 2)) the decoder 2020 sends the ECM to the smartcard, the smartcard decreases the wallet of the smartcard 3020 by 25 tokens, writes the session ID 168; the session mode 169, the session index 170 and the session view 171 in the PPV event description 167 and extracts and deciphers the control word from the ECM:

In the "pre-book" mode, an EMM will be passed to the smartcard 3020 so that the smartcard will write the session ID 168, the session mode 169, the session index 170 15 and the session view 171 in the PPV event description 167 using the EMM:

The session index 170 can be set to differentiate one broadcast from the other. This times out of 5 broadcasts. As soon as an ECM with a session index different from the current session index 170 stored in the PPV event description 167 is passed to the 20 marteard, the number of the session view 171 is decreased by one. When the session view reaches zero, the smartcard will refuse to decipher angECM with a different session index to the current session index.

Experimental value of the session view depends only on the way in which the broadcast supplier, wishes to define the event to which siturclates? the session view for a 25 respective event may take any value.

The microprocessor 110 in the smartcard implements a counting and a comparison program to detect when the limit to the number of viewings of a particular program

of the Carolina companies will provide an action frame and only through

at the concentration of the second

has been reached. A month of the manager of the second of

All of the session ID 168, the session mode 169, the session index 170 and the session view 171 in the PPV event description 167 may be extracted from the smartcard using the "call-back" procedure as described previously.

5 Each receiver/decoder 2020 contains an identifier which may either identify uniquely that receiver/decoder or identify its manufacturer or may classify it in some other way in order to enable it to work only with a particular individual smartcard, a particular class of smartcards made by the same or a corresponding manufacturer or any other class of smartcards which are intended for use with that class of receiver/decoders 10 exclusively.

ule un douge municipales and religions of more of the delication of

In this manner the receiver/decoders-2020 which have been supplied by one broadcast supplier to the consumer are protected against the use of non-authorised daughter smartcards 3020.

Additionally or alternatively to this first "handshake" between the smartcard and the receiver, the EEPROM of the smartcard 3020 could contain a field or bitmap describing the categories of receiver/decoders 2020 with which it can function. These could be specified either during the manufacture of the smartcard 3020 or by a specific EMM.

use his suffect mage with has a fully though the first time to the first that his was

activativity (ACA edity of scrimmatical contents of the content of the contents of

The bitmap stored in the smartcard 3020 typically comprises a list of up to 80 receiver/decoders, each identified with a corresponding receiver/decoder ID with which the smartcard may be used. Associated with each receiver/decoder is a level "1" or "0" indicating whether the smartcard may be used with the receiver/decoder or not, respectively. A program in the memory 2024 of the receiver/decoder searches for the identifier of the receiver/decoder in the bitmap stored in the smartcard. If the identifier is found, and the value associated with the identifier is "1", then the smartcard is "enabled", if not, then the smartcard will not function with that receiver/decoder.

Tarrilla . Later .

5

In addition, if, typically because of an agreement between operators, it is desired to authorize the use of other smartcards in a particular receiver/decoder, specific EMMs will be sent to those smartcards to change their bitmap via the transponder 2014.

grafiya (Ta. mengrapakanana Xix oftolia) kisa

the symmetry of the little of the little

the odd to MORPHE odd in the compa

Each broadcast supplier may differentiate his subscribers according to certain predetermined criteria. For example, a number of subscribers may be classed as "VIPs". Accordingly, each broadcast supplier may divide his subscribers into a plurality of subsets, each subset comprising any number of subscribers.

The subset to which a particular subscriber belongs is set in the SMS 3004. In turn, the SAS 3002 transmits an EMM to the subscriber which writes information (typically of length 1 byte) concerning the subset to which the subscriber belongs into the 10 relevant operator data zone, say 154, of the EEPROM of the smartcard. In turn, as events are broadcast by the broadcast supplier, an ECM, typically of 256 bits, is transmitted with the event and indicating which of the subsets of subscribers may view the event. If, according to the information stored in the operator zone, the subscriber does not have the right to view the event, as determined by the ECM, programme 15 pictor when oda i yttanin 12 km viewing is denied.

This facility may be used, for example, to switch off all of a given operator's smartcards in a particular geographical region during the transmission of a particular program, in particular a program relating to a sports fixture taking place in that geographical region. In this manner football clubs and other sport bodies can sell 20 Obroadcasting rights outside their locality whilst preventing local supporters from viewing the fixture on television. In this manner the local supporters are encouraged 10 I to buy tickets and attend the fixture. We shook A Solu ad year blue is me ad "If it is to a whether the intercent of the period wi

Each of the features associated with zones 151 to 172 is considered to be a separate 25 invention independent of the dynamic creation of zones: 25 od 10 or 2 41

invention.

Each feature disclosed in the description, and (where appropriate) the claims and drawings may be provided independently of in any appropriate combination.

In the aforementioned preferred embodiments, certain features of the present invention have been implemented using computer software. However, it will of course be clear to the skilled man that any of these features may be implemented using hardware. Furthermore, it will be readily understood that the functions performed by the hardware, the computer software, and such like are performed on or using electrical and like signals.
